## ABSTRACT

An object of the present invention is to provide a spark plug gasket (provided on the outer surface of the metal member of a spark plug) which assures a sealing between the spark plug and engine head by elastically deforming itself during screwing in the spark plug into an engine head and at the same time does not easily suffer an plastic deformation during driving the engine. The two requirements for assuring the close contact capability and suppressing the plastic deformation are simultaneously satisfied by a twice or three-times bent gasket with Hv0.5 of greater than or and smaller than or equal to 400. equal to 200 particularly, the twice bent gasket of the thickness of the gasket plate itself of 0.3 mm and made of SUS 304 of Hv0.5 of 350 did hardly suffer a loss of springiness under 50 G vibration.
